

Forecasting El Niño This Winter Season

The Climate Prediction Center has announced El Niño is present across the equatorial Pacific Ocean and based on current observations and dynamical model forecasts, is expected to strengthen and last through the Northern Hemisphere during the winter of 2009-2010.

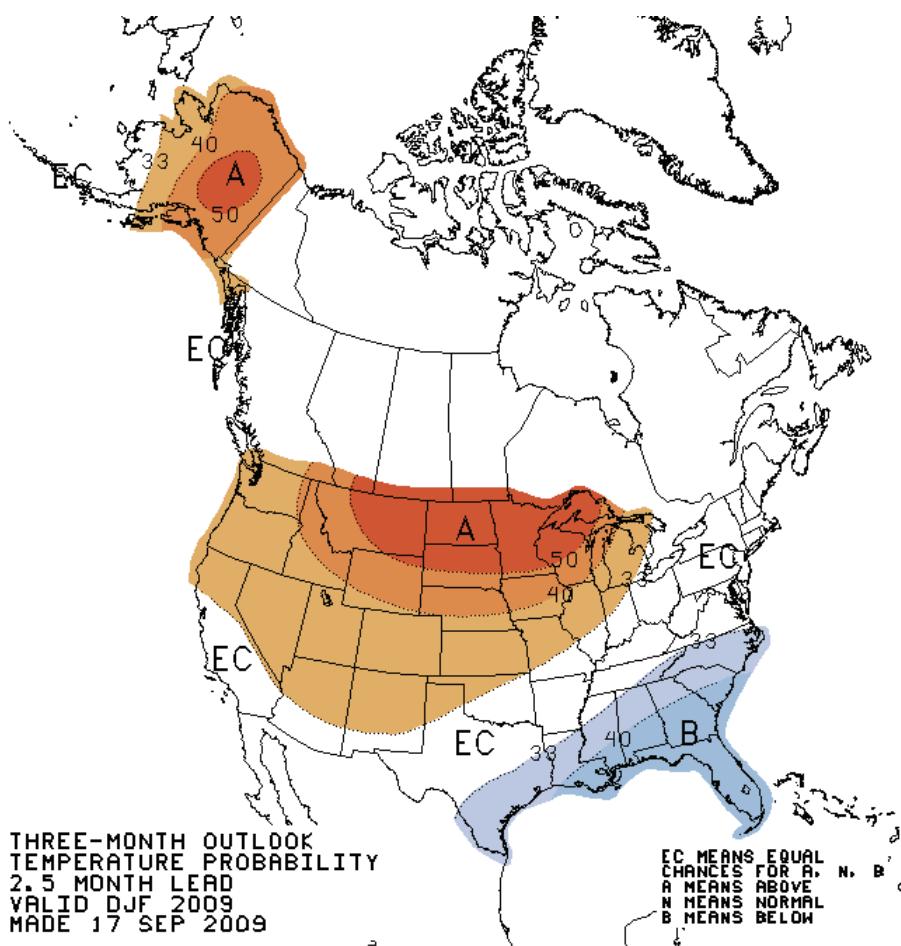

El Niño represents the warm phase of the El Niño-Southern Oscillation, or ENSO, cycle, and is sometimes referred to as a Pacific warm episode. (The cold phase is known as La Niña.) El Niño was originally connected to an annual warming of sea surface temperatures along the west coast of tropical South America. Its name, which means "the little boy" in Spanish, refers to the Christ child and derives from the fact that its occurrence historically coincides with the Christmas season in South America.

Since the 1997-1998 El Niño, one of the strongest of the 20th century, there has been an increased interest in the study and understanding of ENSO forecasts. Decision makers, resource managers, congressional members and staff, and media now understand the significance and value of the oceanic (sea surface temperature) and atmospheric cycles, and other climate systems as they relate to our climate and weather, food supply, natural hazards, and national security.

El Niño can have significant impacts on climate patterns throughout the world, ranging from drought in southern Africa and Australia to increased rains in the Southern United States and warmer than average winter temperatures across the Northern U.S. These climate impacts may effect local food production, the price of produce, the income from ski resorts, winter heating bills, and much more.

As the nation's leading ocean-atmosphere science agency, NOAA is monitoring and forecasting El Niño and studying the impacts of this event on marine life, coastal areas, coral reefs, smoke from fires in regions of drought, vegetation growth, threat to drinking water, and many other areas. An extensive climate observing system in the tropical Pacific Ocean has been a critical component in understanding and predicting seasonal climate variability. In addition to their role in weather forecasting, NOAA satellites are used to capture El Niño signatures by monitoring sea surface temperatures as well as receiving data from NOAA's data buoy network. NOAA offers unique insights into the way the oceans and the atmosphere interact. This has led to improved forecasts of seasonal and inter-annual climate variations such as El Niño, resulting in hundreds of millions of dollars of savings per year within the U.S. economy and abroad.

To learn more about El Niño, please visit <http://www.elnino.noaa.gov>.

This is the latest (as of September 17) temperature outlook for the winter (December - February).

WDTB: Warning Decision Training Branch

Located in Norman, Oklahoma at the National Weather Center (NWC), the Warning Decision Training Branch (known as WDTB), has been providing training and education to NOAA's NWS forecasters (meteorologists and hydrologists) for almost 20 years. WDTB courses focus on operational warning-related science, technology, and decision making topics. The mission: to transfer knowledge of weather phenomenon into warnings that protect the public from dangers such as tornados, flash floods and winter storms.

Students participating in the February 2009 DLOC Workshop.

One of WDTB's most popular training courses is the WSR-88D Distance Learning Operations Course (DLOC), that teaches the effective use of the WSR-88D Radar for forecasting and warning. DLOC celebrates its 20th anniversary this month. Although it has a long history, the course has been constantly updated, evolving with scientific research and technology. From 1990 to 1997, it was taught in residence at Norman with more than 2,000 meteorologists attending. The "Ops Course" was taught by former and past WDTB (then OTB – Operations Training Branch) personnel. In 1997, the course was restructured into a blended distance learning format, which better accommodated flexible working schedules and reduced travel costs. DLOC now incorporates a combination of delivery methods including instructor-led teletraining, self-guided web modules, and Weather Event Simulator (WES) warning simulations. There is even a residence portion of the course called the DLOC Workshop. For more information on WDTB, DLOC and other courses, visit www.wdtb.noaa.gov.

EMPLOYEE SPOTLIGHT: *Andrea Ray*

Tell us about your job.

My formal title is Physical Scientist at NOAA Earth System Research Lab in Boulder, but my work on applications of climate information and forecasts is really interdisciplinary, using both social and physical sciences. I've worked a lot with the Bureau of Reclamation, which manages Lake Powell & Lake Mead on the Colorado River. I document needs for climate information, refine research questions, and connect research and applications. I've been involved with the Weather and Society*Integrated Studies (WAS*IS) community as well, bridging weather and climate time scales for applications.

How does your work relate to climate change?

In the Intermountain West where runoff is dominated by snowmelt, climate change has the potential to significantly affect water availability for humans and ecosystems. Temperatures have already increased in the West and these trends are likely to continue. Impacts include earlier snowmelt, higher evaporation, and higher water demands. I work on how to translate these physical impacts into the needed information for operations and management decisions such as water supply planning and ecosystems management.

What brought you to NOAA?

I started at NOAA in the headquarters for OAR in 1991, after spending a year at the Office of the Oceanographer of the Navy as a Knauss Sea Grant Fellow. I moved to Boulder on a NOAA long-term training program to do my Doctorate in Geography and to put those skills to work on climate applications.

What achievements are you proudest of?

Last year, I led a group of scientists that wrote a report on the impacts of climate change for water resources in Colorado. We were finalists for the Governor's Award for Research Impact in the state. I've been involved with the NOAA-funded North American Monsoon Experiment, which has resulted in experimental monsoon outlooks and increased interactions between NOAA and Mexican researchers.

What do you do for fun?

I'm getting ready to do a women-only 100-kilometer bike ride called The Venus de Miles. When I travel, I like to hike and explore the outdoors in that area and to go to art museums.

ATDD Interns Add New Perspective

Summer 2009 interns and research assistants pictured at ATDD in Oak Ridge, TN.

Ridwaana Allen collects ammonia samples at Walker Branch Watershed in Tennessee.

David John Gagne remotely retrieves data from ATDD's meteorological network.

Kenneth Pratt inflates a research weather balloon in preparation for launch with a radiosonde.

Samuel Ubanyionwu studies sample flow rates at a MCADS site near Wiggins, MS.

Four NOAA scholars (participants in the EPP Undergraduate Scholarship Program and the Ernest F. Hollings Undergraduate Scholarship Program) and one Spelman College Howard Hughes Fellow completed summer internships at the Atmospheric Turbulence & Diffusion Division (ATDD). ATDD is a NOAA Air Resources Laboratory (ARL) field office located in Oak Ridge, TN with a total staff of 40, including 10 scientists. These five summer interns were dedicated and inquisitive, which led to both research mentors and interns broadening their scientific perspectives.

Spelman College sophomore Ridwaana Allen is a first-year Howard Hughes Summer Research Fellow. She and her mentor, Dr. LaToya Myles, explored the influences of local emissions sources on atmospheric ammonia concentrations in East Tennessee. Ridwaana's research has contributed to a better understanding of the dynamics of ammonia concentrations in the atmosphere and has been developed into a manuscript for publication.

NOAA scholar David John Gagne II from the University of Oklahoma was mentored by Dr. Ron Dobosy. David John used an innovative approach in the statistical correction of numerical wind and temperature forecasts. His equations were developed from the Weather Research and Forecast (WRF) Model using wind and temperature data from the East-Tennessee Regional Air Monitoring & Analytical Network. David John will present his research findings at the American Meteorological Society Annual Meeting in January 2010 .

Aziza Marchant, a NOAA scholar from Savannah State University, teamed with Dr. Tilden Meyers to develop best management practices for power usage at over 100 U.S. Climate Reference Network stations. Her research evaluated the relationship between aspirated and non-aspirated temperature sensors, which could lead to cost-effective solar and battery power management in the network.

Another NOAA scholar, Kenneth Pratt from Pennsylvania State University, worked with Will Pendergrass to study the effects of atmospheric stability on fine particulate matter concentrations in a unique topographic area surrounding the I-40/Watt Road interchange in Knoxville, TN. Kenneth's research is part of a larger program at ATDD to study how dispersion of atmospheric compounds is affected by physiographic features such as the corrugated terrain of the East Tennessee Valley.

Samuel Ubanyionwu, a NOAA scholar from Texas Southern University, was mentored by Dr. LaToya Myles and participated in a collaborative field project, the Mississippi Coastal Atmospheric Dispersion Study (MCADS). In June 2009, Samuel measured atmospheric nitrogen and sulfur compounds at two sites just north of the Gulf of Mexico. Data from Samuel's field research have been incorporated into atmospheric dispersion models to identify potential emissions sources.

As a way of sharing their research outcomes with a larger scientific community, each summer intern made a presentation during the ARL laboratory-wide seminar series in July 2009. NOAA scholars also presented their work at the 2009 Science and Education Symposium in Silver Spring, MD. The enthusiasm these interns brought to NOAA research was contagious and has spurred an interest to host another group of interns next year.

Central Region Resources

OFFICES

There are several states within NOAA's Central Region which contain hubs of specific activities. Boulder, Colorado is one such hub which focuses on research. This section provides information on a sampling of these offices. Be sure to check out the corresponding links for more information!

WEBSITES

CLIMATE PROGRAM OFFICE

<http://www.climate.noaa.gov>

A great deal of valuable information and numerous resources available for your use. This easy to navigate site provides educational information, data and products, a library of presentations and publications, links to other climate sites, and so much more!

UNITED STATES CLIMATE CHANGE RESEARCH PROGRAM

<http://www.globalchange.gov/publications/reports/scientific-assessments/us-impacts>

Access "Global Climate Change Impacts in the United States", a report which summarizes the science and the impacts of climate change on the United States, now and in the future. It focuses on climate change impacts in different regions of the U.S. and on various aspects of society and the economy. This report has received a great deal of publicity, including a rollout at the White House. View the full report, as well as regional factsheets, a highlights brochure, and additional resources.

EL NIÑO

<http://www.elnino.noaa.gov>

For the latest El Niño information, forecasts, impacts, graphics and more, visit the new NOAA El Niño website, a one stop shop for NOAA employees as they communicate impacts of the 2009-2010 El Niño.

EMPLOYEE SPOTLIGHT: *Andrea Ray*

(Continued from page 2)

What's next for you?

Western natural resource managers are asking NOAA for guidance on climate change, for example to include in forest management plans or to assess the potential for climate change to threaten species. These include the U.S. Fish and Wildlife Service, the National Forest Service, and the National Park Service. I'm working to engage stakeholders from these agencies to understand their needs for climate, by looking at their key decisions and decision processes, and entry points for climate information. Then we'll work together to "co-produce" useable science for their needs.

How can people contact you?

Andrea.Ray@noaa.gov and 303-497-6434. I'd be willing to talk to other people interested in applications of climate and weather information in the Central Region.

Email noaa.centralregion@noaa.gov and share your ideas on the next employee to feature.
